## Experiment No.: 5

### Building Sales Performance Dashboards

#### Problem Statement

You are a Sales Analyst for a retail chain. The sales director wants to monitor revenue, profit, product performance, and regional sales through a single dashboard. Design an interactive sales dashboard that supports data-driven decision-making.

#### Methodology / Steps Followed

##### Step 1: Data Collection

- Obtained the Walmart sales dataset in CSV format.
- Verified that the dataset contained sales, store, holiday, fuel price, temperature, CPI, and unemployment information.

##### Step 2: Data Import

- Opened Power BI Desktop.
- Imported the Walmart CSV dataset using the **Get Data** option.
- Loaded the dataset into Power BI for analysis.

##### Step 3: Data Cleaning and Transformation

- Checked for missing values and duplicate records.
- Verified and corrected data types for all columns.
- Created additional columns including **Year**, **Month**, **Quarter**, and **Holiday Type** for analysis.
- Formatted date columns and sorted month names using the Month Number column.

##### Step 4: Data Modeling

- Verified relationships and data integrity within the dataset.
- Created DAX measures for:
  - Total Weekly Sales
  - Average Weekly Sales
  - Best Performing Store
  - Worst Performing Store
  - Holiday Sales

## Step 5: Dashboard Development

- Created KPI cards for:
  - Total Weekly Sales
  - Average Weekly Sales
  - Best Performing Store
  - Worst Performing Store
  - Holiday Sales
- Added slicers for:
  - Store
  - Year
  - Month
  - Holiday Type
- Developed interactive visualizations including:
  - Weekly Sales Trend (Line Chart)
  - Top Store Sales (Clustered Column Chart)
  - Holiday vs Non-Holiday Sales by Month (Stacked Column Chart)
  - Temperature vs Weekly Sales (Scatter Chart)
  - Store-wise Sales Contribution (Treemap)
  - Holiday Sales Distribution (Donut Chart)
- Applied formatting, color themes, titles, and interactive filters to create a professional dashboard.

## Output

An interactive Sales Performance Dashboard was successfully developed in Power BI using the Walmart sales dataset. The dashboard provides an overview of weekly sales performance through KPI cards and multiple interactive visualizations. Users can analyze sales trends over time, compare store performance, evaluate holiday and non-holiday sales, observe the relationship between temperature and sales, identify store rankings, and understand monthly sales changes. Interactive slicers for Store, Year, Month, and Holiday Type enable dynamic filtering, making the dashboard user-friendly and effective for business analysis.

## **Conclusion**

The Sales Performance Dashboard was successfully designed and implemented in Power BI. The dashboard combines KPI cards, interactive charts, and slicers to present meaningful business insights from the Walmart sales dataset. It enables users to monitor sales trends, compare store performance, evaluate seasonal and holiday impacts, and make informed business decisions. Overall, the dashboard transforms raw sales data into a clear, interactive, and decision-oriented business report.

## **Learning Outcomes**

After completing this experiment, I learned:

- How to import and prepare business data in Power BI.
- How to clean and transform sales data for analysis.
- How to create DAX measures for KPI calculations.
- How to develop interactive KPI cards and business dashboards.
- How to create Line, Column, Scatter, Ribbon, Treemap, Donut, and Waterfall charts.
- How to use slicers for interactive dashboard filtering.
- How to apply professional formatting and dashboard design principles.
- How to analyse sales trends, store performance, and holiday sales using Power BI visualisations.
- How to present business insights that support data-driven decision-making.
